CAIRO, (Egypt.)

METEOROLOGICAL OFFICE.

REPORT ON THE WEATHER OF JANUARY 1914.

EIGHTH YEAR: No. 1.

During this month the temperature was everywhere above the average.

The amount of rain over Lower Egypt was in considerable defect owing to the unusual absence of deep depressions. However, an excess of rainfall was observed at Port Sudan, where the winter rains this season are unusually late, and in consequence there has been distress amongst the inhabitants owing to the lack of grazing for their cattle.

The weather of the first fortnight of the month was under the influence of several shallow depressions which passed north of Egypt, causing moderate to strong southerly or south-westerly winds and some rain over the Delta on the 9th and 10th.

On the 18th a shallow depression appeared over the Central Mediterranean, deepened on the 19th, but disappeared suddenly to the north of Greece on the 20th. It caused light hot southerly winds over Egypt.

For the rest of the month the weather was unusually calm and settled.

In Egypt and the Sudan pressure was below average except for the Mediterranean and Red Sea districts where it was slightly above average.

Table showing the departures from normal of January 1914, by districts.

Districts	Barometer at 8 a.m. reduced to 0°C. S.L. & M.G.		Temperature						Rainfall	
			Maximum		Minimum		(Max. + Min.)/2

VII South Sudan	756·8	0·0	38·3	+1·5	20·9	+1·9	29·6	+1·7	0	−3
VIII Equatorial	—	—	—	—	—	—	—	—	—	—

* For Port Sudan only.

State of the River. — The Bahr el Jebel was almost stationary throughout the month and is now 40 cms. below normal. This is better than it was last year at this time. The River Sobat is very low and was 1·80 m. below normal on January 10, at Doleib Hill. The White Nile has only fallen 20 cms. during January and so has improved about 70 cms. relatively to the normal, and is now 1·10 m. below normal at Malakal.

The Blue Nile is not falling very fast owing to its low level, and is now 97 cms. and 1·33 m. below normal at Roseires and Khartoum respectively, that is to say, lower than the lowest level usually reached.

The Main Nile is now falling a little more slowly than usual and is 1·27 m. below normal at Wadi Halfa.

Comparison of Thermometric Scales

PROBABLE WEATHER — for 24 hours ending noon 21/1/1914.

Pressure is now rising rapidly and the depression seems to be passing away in the north. West or north-west wind with some rain is probable.

REMARKS:

A storm warning was sent to the Ports yesterday.

METEOROLOGICAL OFFICE

REPORT ON THE WEATHER OF FEBRUARY 1914.

EIGHTH YEAR: No. 2.

The first three weeks of the month were practically normal, but the last a little warmer than usual. The mean temperature for the month was everywhere practically average except in the Southern Sudan where it was above average.

Over all our districts rainfall was in defect owing to the fact that no depressions entered the Eastern Mediterranean during the month, but showers were very often observed on the shore line.

The weather was in consequence of a settled character throughout, except for the following occasions viz :—

(i) from the 3rd to 5th when a shallow depression was formed north of Egypt and caused southerly winds and light precipitation on the coast line.

(ii) from the 16th to 18th when a V-shaped depression was formed north of Alexandria and gave rise to south-westerly winds and some rain.

During the last decade of the month pressure was high to the east and low to the west of this country causing a general rise of temperature and khamsin weather on the 27th, when the maximum temperature near Cairo was 10° above the average, reaching 32°C. In Egypt and the Sudan pressure was a little above average except for the Saharan and Southern Sudan districts where it was a little below average.

Table showing the departures from normal of February 1914, by districts.

VIII Equatorial†	—	—	—	—	—	—	—	—	1	−36

* For Port Sudan only. † For Zanzibar only.

State of the River.— Lake Victoria mean level for January was 10 cms. higher than it was last year. The Bahr el Jebel fell 11 cms. in February but still was better then it was last year, being 45 cms. only below normal. The Bahr el Ghazal (up to Feb. 7) was 90 cms. below the average level of the corresponding days in 1912 and 1913. The River Sobat was almost stationary throughout the five weeks ending February 7, when it read about one metre below normal. The White Nile remained stationary during February and is now 63 cms. below normal. The Blue Nile has fallen less than usual and is now 79 cms. below normal at Roseires and Khartoum respectively. The Main Nile at Wadi Halfa is now one metre below the average for the last 24 years, and this is the lowest on record for this time of the year.

H. E. Hurst,
Superintendent Meteorological Office.

Giza, March 4th, 1914.

Survey Department, Ministry of Finance

CAIRO, (Egypt.)

METEOROLOGICAL OFFICE.

REPORT ON THE WEATHER OF MARCH 1914.

EIGHTH YEAR: No. 8.

The mean temperature for the month was everywhere well above the average while for the same month last year it was as much below the average.

Rainfall was slightly in defect over Lower Egypt, and practically normal everywhere else except at Mongalla, where there was a considerable excess.

The weather for the month although not of an unsettled character, was nevertheless remarkable for the unusual occurrence of high pressure centres in the Eastern Mediterranean; and also for departure from the usual rule that when the pressure is high the temperature is low and vice versa.

Pressure was above average over all our districts except for the Sahara and Northern Sudan where it was practically normal.

Table showing the departures from normal of March 1914, by districts.

* For Port Sudan only. † For Zanzibar only.

State of the River. — According to latest information, the Victoria and Albert mean lake levels for February and January were 5 cm. and 8 cm. respectively higher than last year. The Bahr el Jebel mean for March was 5 cm. higher than that of last year, and is now (April 4) 46 cm. below normal at Mongalla gauge, but is falling more slowly than usual. At Malakal, the White Nile is now 47 cm. below normal. The Blue Nile is 67 cm. and 68 cm. below normal at Roseires and Khartoum respectively. The Main Nile at Wadi Halfa has fallen 12 cm. during the month whereas the average fall is 44 cms. It is now 67 cm. below normal.

Forecast of the gauge at Roseires in May. — The mean level at Roseires in May predicted from meteorological factors over the Indian Ocean by the method explained in the attached note, is 10·8 metres on the gauge or 0.9 metres below normal. The odds against the river reaching the normal in May are fairly heavy.

H. E. Hurst,
Superintendent Meteorological Office.

Giza, April 4th, 1914.

NOTE ON FORECASTING THE SPRING RAINS.

It often happens that the first rise of the Blue Nile occurs in May owing to rains in Abyssinia. Investigations into the causes of these rains have been made, with the idea that it might be possible to give some prediction of these and the consequent rise of the Nile. It is now thought that the rains which cause the flood proper come from the South Atlantic, while investigation has shown that the early rains on the other hand probably come from the Indian Ocean.

No explanation of their cause can be given as yet, but empirical connections have been established between them and meteorological phenomena at places in and around the Indian Ocean. In fact the Indian Ocean and the surrounding countries in the spring form a connected system as far as weather is concerned.

The difference between the heights of the Blue Nile at Roseires in May and March was chosen as a measure of the rains, and this has been connected with Indian Ocean meteorology during March, and an equation obtained from which a prediction of the Roseires level can be calculated. Thus the mean level for May can be predicted at the beginning of April.

The results are shown diagrammatically in the figure where the actual Roseires gauge is plotted, and also the values of it obtained from this equation.

It will be seen that there is fairly close agreement, between the actual and predicted gauge, the greatest discrepancy being 45 cm. The closeness of agreement is best expressed by saying that the probable error of the theoretical curve is ± 19 cms. meaning that the difference between the two is as likely to be less as greater than 19 cms.; or to put it in another way, it is an even chance that the actual value lies within the 19 cms on each side of the theoretical value; the odds are 9 to 2 that it lies within 38 cms.; and 21 to 1 that it is within 57 cms of the theoretical value.

For actual prediction, however, the odds are not quite as favourable as this. The connections on which the theoretical curve is based have been obtained for the 14 years for which we have readings of the gauge at Roseires. This is a comparatively short period on which to base statistical results, and it has happened in other regions, sometimes, that close connections between weather phenomena have existed for several years and then disappeared. This may happen in the case of the Nile and weather in the Indian Ocean, though we have not enough observations to say how likely this is, nor can it be foreseen from present knowledge. The prediction is of course strengthened by the fact that it does not rest on a single phenomenon, but on scattered ones as far apart as Calcutta and Zanzibar.

On the whole a fair estimate is that the odds in favour of the prediction are half the theoretical ones previously given, that is roughly 10 to 1 that the prediction lies within 60 cms. of the truth.

As a criterion of the meaning of these odds it may be pointed out that, if we had no knowledge at all of the regimen of the river or of its relationship to meteorology, the only possible prediction would be that the river in May would have the mean value of previous years. In this event there would be only an even chance of our prediction being within 50 cms of the truth.

FORECAST OF THE SPRING RAINS.

Probable Weather - for 24 hours ending noon 29/3/14
Southerly winds changing to northerly later.
Temperatures above normal, but the depression of yesterday is probably too far to have great effect on the weather of Egypt.

Survey Department, Ministry of Finance

CAIRO, (Egypt.)

METEOROLOGICAL OFFICE.

REPORT ON THE WEATHER OF APRIL 1914.

EIGHTH YEAR: No. 4.

The mean temperature during April was below the average in all districts except in the Central and Southern Sudan.

In Egypt the temperatures in the first and last weeks were considerably below normal, while those of the middle weeks were practically normal. During the last forty-seven years at Abbassia there have been two years when the average temperatures for April have been lower and one year when it was the same as the average for this year.

Rainfall was in excess over the Mediterranean Coast line, practically normal over Egypt and the Northern and Central Sudan, while it was below normal in the Southern Sudan. At Zanzibar rainfall was in excess.

The weather for the month was affected on two occasions by depressions crossing the Eastern Mediterranean basin which caused rains and strong winds over Egypt. Otherwise light to moderate cold breezes were the chief feature of the month.

Pressure was above average over all districts.

Table showing the departures from normal of April 1914, by districts.

VIII Equatorial†	—	—	—	—	—	—	—	—	322	+27

* For Port Sudan only. † For Zanzibar only.

State of the River. — The Victoria and Albert mean lake levels for March and February were 3 cm. and 9 cm. respectively higher than the corresponding levels of last year. The mean level for April of the Bahr el Jebel at Mongalla was 14 cm. lower than that of last year, while at Mongalla on the 27th the level was 69 cm. below normal. The average levels of the Bahr el Ghazal and River Sobat for the first week of April were about 50 cm. and 25 cm. respectively below normal. At Malakal, the White Nile is now (May 2) 38 cm. below normal. On the Blue Nile during the latter half of the month there was a rise of 97 cm. at Roseires, but the river has now fallen to within 25 centimetres of where it was at the middle of April, and is now 53 cm. below normal. This rise is now affecting the levels at Khartoum which at the present is 22 cm. better than it was at the beginning of the month. The gauge at Halfa on the 1st May was reading 92 cm., i.e. 50 cm. below normal.

H. E. Hurst,

Superintendent Meteorological Office.

Giza, May 4th, 1914.

PHYSICAL SERVICE.

REPORT ON THE WEATHER OF MAY 1914.

EIGHTH YEAR: No. 5.

The temperature in Lower Egypt was below the average for the first and last weeks of the month, and above the average during the third week. In Upper Egypt the temperature was below during the first week, above during the third, and practically normal for the rest of the time. For the whole month the departures from normal were small. Mention may be made of high temperatures in Egypt on the 18th and 19th, and of the exceptionally high temperatures on the 30th and 31st, when 45° was reached at Helwan and 40° at Alexandria.

The month has been remarkable for the number of unusual pressure distributions. On the whole it may be said that the high pressure which is usually over the Sahara was much further north during the month. Pressure in Egypt was above normal, partly owing to this, but was practically normal in the Sudan.

Egypt was as usual nearly rainless. The rainfall of the Sudan was practically normal, while those of Adis Ababa and Zanzibar were below normal.

Table showing the departures from normal of May 1914, by districts.

Districts	Barometer at 8 a.m. reded to 0°C, S.L. & M.G.		Temperature						Rainfall	
			Maximum		Minimum		(Max. + Min.)/2

* For Port Sudan only. † For Zanzibar only.

State of the River. — On the whole during May the river has everywhere been below normal. The White Nile at Malakal was about three weeks late in rising and was about 60 cm. below normal in the average. During the last decade heavy rains in the neighbourhood of Roseires caused the Blue Nile to rise, but the average has not yet reached the normal although sudden flushes have carried it above normal. It may be mentioned that the forecast issued early in April for the mean level of the Blue Nile at Roseires during May was 0·9 metres below normal, and the actual mean level was 0·8 metres below normal, a difference of only 10 centimetres from the forecast. The rise of the Blue Nile in April was felt at Halfa in the latter part of May but has now nearly passed, leaving Halfa at the end of the month about 30 cm below normal.

H. E. Hurst,
Superintendent Meteorological Office.

Cairo, June 3rd, 1914.

PHYSICAL SERVICE.

REPORT ON THE WEATHER OF JUNE 1914.

EIGHTH YEAR: No. 6.

During the month a number of shallow depressions, advanced along the Mediterranean causing southerly winds to be more frequent than usual. The hot weather which commenced on the 29th of May lasted until June 2nd, by which time the wave had moved over the Northern Sudan, but was there much less intense. The record temperatures of 44° at Giza and 45°, at Helwan were reached on June 1. On the whole, average temperatures have prevailed during the month except in the Northern Sudan, where the minimum temperatures have been higher than usual. The pressure has been practically normal over the whole region. It may be noted that high pressures over north-east Africa at this time of the year are unfavourable to the deposition of rain on the highlands of Abyssinia.

As far as the stations whose reports have already been received are concerned, the rainfall in the Sudan was about 10% above average. Heavy rains are reported from Gallabat.

Table showing the departures from normal of June 1914, by districts.

„ „	Renk	72	+18	Red Sea Coast	Port Sudan	0	0

State of the River. — The river on the average of the month was everywhere below normal. Lake Victoria May levels were 9 cms below the corresponding levels of last year. The levels at Mongalla (Bahr el Jebel) and Malakal (White Nile) were about 60 cms below normal in June. The Blue Nile at Roseires was much above normal during the second week and 30 cms. below on the average of the month.

The mean level of the Main Nile at Halfa was lower than it had been in June for the last 24 years though only 5 cms lower than the mean in 1912. It is now 80 cms. below normal at Halfa.

This is due to the low flood of last year, and the lack of rain in Abyssinia in May. However the Main Nile has now commenced to rise and there has also been a rise on the Atbara which has brought Khashm el Girba gauge up to normal.

H. E. Hurst,

Superintendent Meteorological Office.

BAROMETER AND WIND 8 A.M.

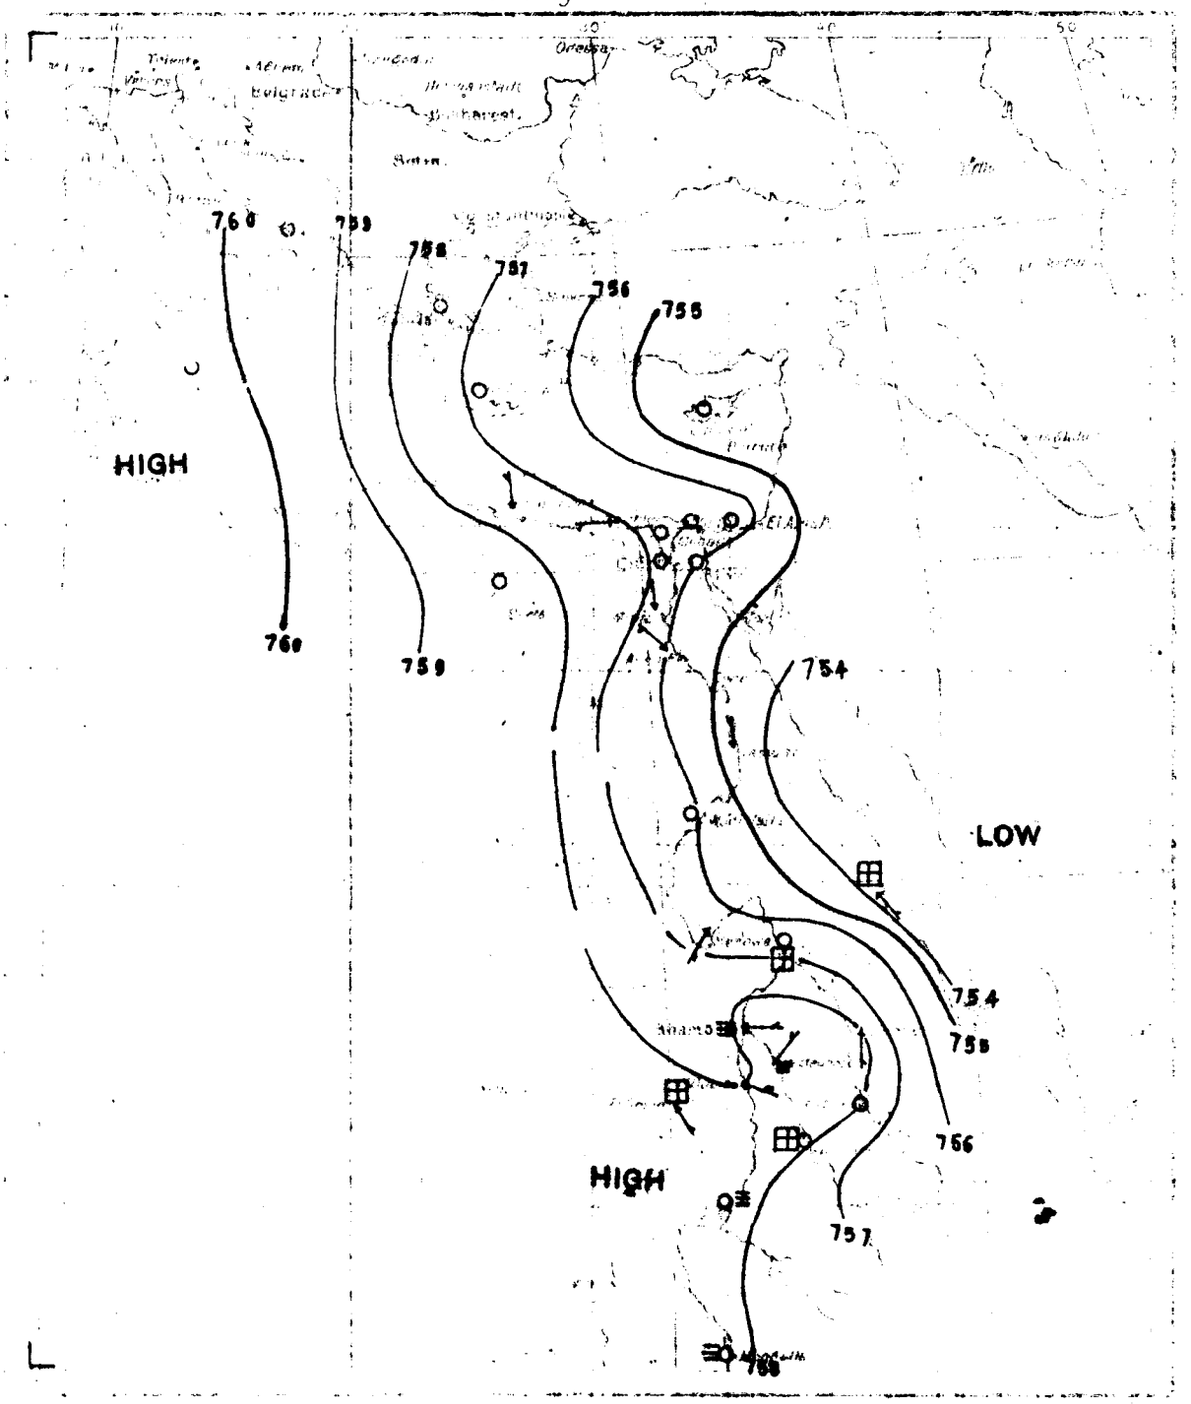
Yesterday **30 - 7 - 1914**



Survey Department, Ministry of Finance

PHYSICAL SERVICE.

REPORT ON THE WEATHER OF AUGUST 1914.

EIGHTH YEAR: No. 8.

Temperature in Egypt and the Sudan has been practically average excepting on the Red Sea Coast, where it was a little above the average. In Lower Egypt the weather was hotter than usual on the 9th, 10th and 11th, especially at Suez where temperatures of 43° were registered, while the highest recorded in Cairo was 39°.

The pressure was slightly above normal in Egypt and the Northern Sudan, and practically normal in the remainder of the Sudan.

At Giza the mean humidity was about 62 per cent which is normal for this time of the year.

As far as the information reeeived up to the present shows, rainfall in the Blue Nile district of the Sudan has been above normal, while at stations on the White Nile it has been somewhat below normal.

Table showing the departures from normal of August 1914, by districts.

State of the River. — During the month the White Nile on the whole has been below normal, though not so much so as in 1913. The Blue Nile, the Atbara and the Main Nile at Wadi Halfa on the whole have been above normal, but have now commenced to fall.

This fall has also shown itself at Halfa, where the highest level 8·25 metres on the gauge was reached on August 24th.

H. E. Hurst,
Superintendent Meteorological Office.

Cairo, September 6th, 1914.

BAROMETER AND WIND 8 A.M.

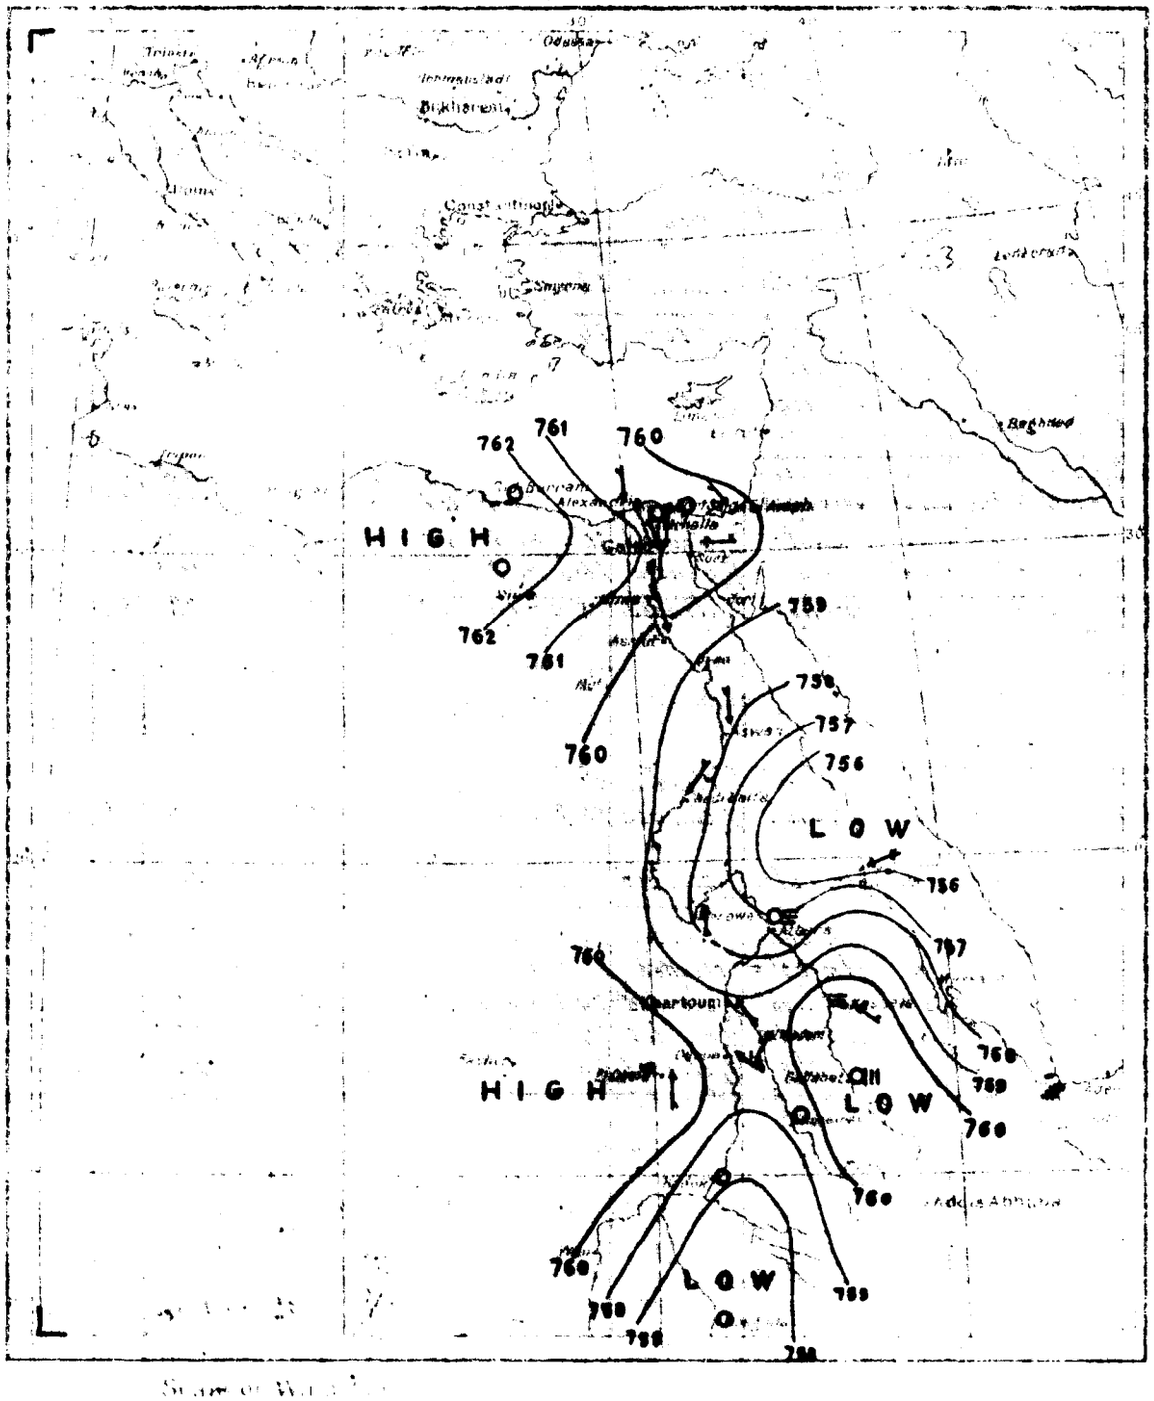
Yesterday 30-8-1914



Survey Department, Ministry of Finance

PHYSICAL SERVICE.

REPORT ON THE WEATHER OF SEPTEMBER 1914.

EIGHTH YEAR: No. 9.

The weather as is usual during September has been settled. From the 17th to the 20th, he temperature over Egypt and the Northern Sudan was somewhat below the average, vhile from the 24th to the 28th, the temperature in Egypt was at most places well above he average during the day, the maximum reached in Cairo being 38°.

On the average of the month temperatures were practically normal everywhere. n the Southern Sudan, however, the average maximum was lower than usual.

Pressure in most districts was a little above normal.

The usual summer distribution persisted during the month with occasional appearnces of the transition form.

Humidity at Giza was practically normal.

Egypt and the Red Sea Districts were rainless as usual, the northern Sudan which as a slight rainfall, had less than usual, the Central Sudan rainfall was normal, but the ainfall of the Southern Sudan, which however depends on one station only, was above normal.

The rainfall at Adis Ababa is reported as being much above normal.

Table showing the departures from normal of September 1914, by districts.

„ „	Renk	—	—	Red Sea Coast	Port Sudan	0	0

State of the river. — Lake Victoria during July was below normal by about 30 cms. nd was lower than at the corresponding time in 1913.

The White Nile at Mongalla has been below normal all the month, but is now only ightly below normal.

The Blue Nile, neglecting oscillations, has fallen very little during September, which ows that the rain recorded at Adis Ababa must have been general in Abyssinia. The tbara also has fallen more slowly than asual.

All important gauges are at the moment of writing practically normal with the ption of those on the Blue Nile which are above normal.

H. E. Hurst,

Superintendent Meteorological Office.

Cairo, September 6th, 1914.

BAROMETER AND WIND 8 A.M.

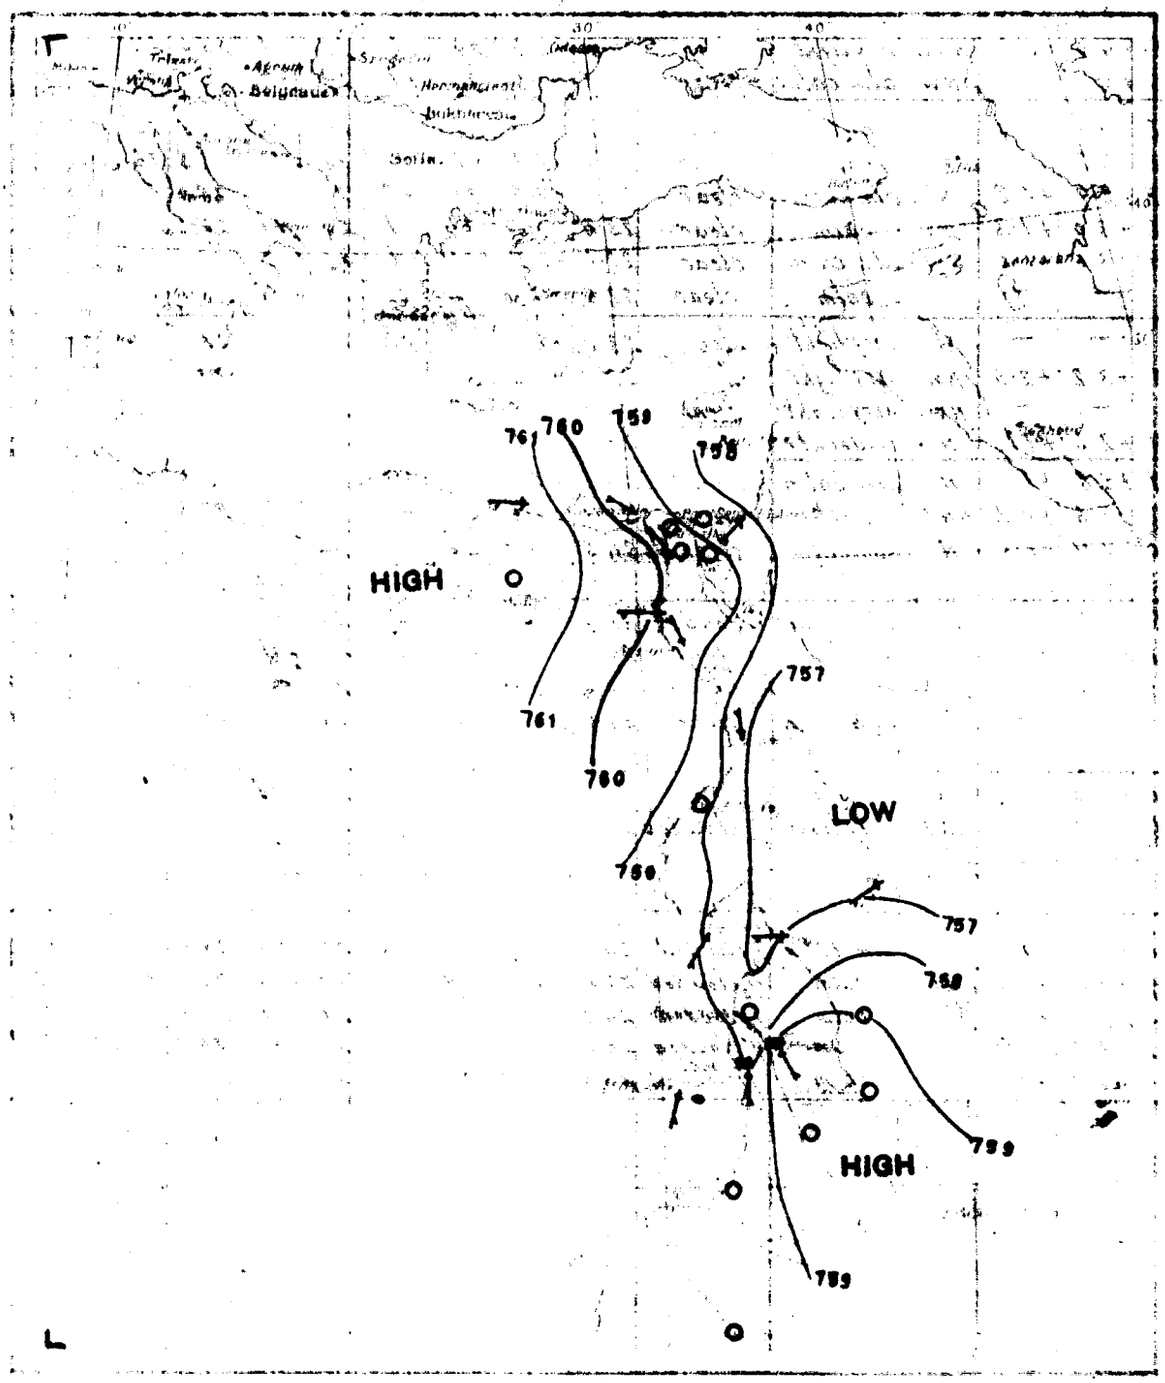
Yesterday **29-9-1914**



Survey Department, Ministry of Finance

PHYSICAL SERVICE.

REPORT ON THE WEATHER OF OCTOBER 1914.

EIGHTH YEAR: No. 10.

The weather during the month has been of a settled character. During the first three weeks temperature over Egypt and the Sudan was well below normal, but during the last week a hot wave spread over northern Egypt, giving maximum temperatures at Giza and Helwan of 36° C. on the 29th and 30th, or about 9° above normal. At Alexandria the temperature reached 38° C. or 12° above normal. On the average of the month temperatures were slightly below normal everywhere.

Pressure was in all districts above the average, and the distribution in the Sudan was of the transition type which occurs at the change from summer or rainy season conditions to winter conditions.

Humidity at Giza was 4 per cent below the average.

Owing to the absence of depressions, rainfall was below average over the Mediterranean district. Over the other districts rainfall was normal, except in the Central Sudan, where it was slightly above normal.

Table showing the departures from normal of October 1914, by districts.

Districts	Barometer at 8 a.m. reduced to 0°C. S.L. & M.G.		Temperature						Rainfall	
			Maximum		Minimum		(Max. + Min.)/2

VII South Sudan†... ...	758·1	+0·2	32·2	−1·6	21·0	+0·3	26·6	−0·6	123	+1
VIII Equatorial	—	—	—	—	—	—	—	—	—	—

* For Port Sudan only. † For Mongalla only.

State of the River. — The White Nile and Bahr el Jebel have been practically normal throughout the month, while the Blue Nile and Main Nile have been above normal. At the present time the gauge at Halfa is about 60 cms. above normal and that at Roseires more than 2 metres above normal.

The flood of 1914 started late, rose rapidly to levels well above normal and then commenced to fall earlier than usual; this fall however was retarded and the flood prolonged, giving levels in October much above the average.

H. E. Hurst,
Superintendent Meteorological Office.

Cairo, November 8th, 1914.

PHYSICAL SERVICE.

REPORT ON THE WEATHER OF NOVEMBER 1914.

EIGHTH YEAR: No. 11.

With the exception of the period from the 25th to the end of the month during which strong southerly winds and rain and unsettled weather were experienced, the weather of the month was of a normal character. In Lower Egypt the first and last weeks were warmer than usual while the two middle ones were slightly colder. In Upper Egypt, temperatures were above the average with the noticeable feature that the minimum temperatures were much above the average. On the average of the month, temperatures were above average except in the southern Sudan where they were slightly below average.

Pressure was everywhere below the average. In the Sudan the transition type of isobars persisted until the 11th after which the transition and winter types alternated.

Humidity at Giza was 3 per cent below average.

Over Lower Egypt rainfall was normal. In the Sudan it was above the average except for the region round Port Sudan were it was below the average.

Table showing the departures from normal of November 1914, by districts.

Districts	Barometer at 8 a.m. reduced to 0°C, S.L. & M.G.		Temperature						Rainfall

VIII Equatorial	—	—	—	—	—	—	—	—	—	—

* For Port Sudan only. † For Mongalla only.

State of the River. — The Bahr el Jebel and the White Nile have been slightly above normal throughout the month. The Blue Nile and Main Nile have been much above normal, but they are now (December 1) only 83 cms. and 49 cms. above normal at Roseires and Halfa respectively. The flood of 1914 although practically normal in volume (2 % below) has been remarkable for the way in which the Blue Nile remained almost steady at the end of the flood season instead of falling, thus bringing what promised to be a deficient flood practically up to the normal. The flood on the Blue Nile was late in starting, rose rapidly to levels above the normal, fell rapidly at first and then very slowly.

H. E. Hurst,
Superintendent Meteorological Office.

Cairo, December 3rd, 1914.

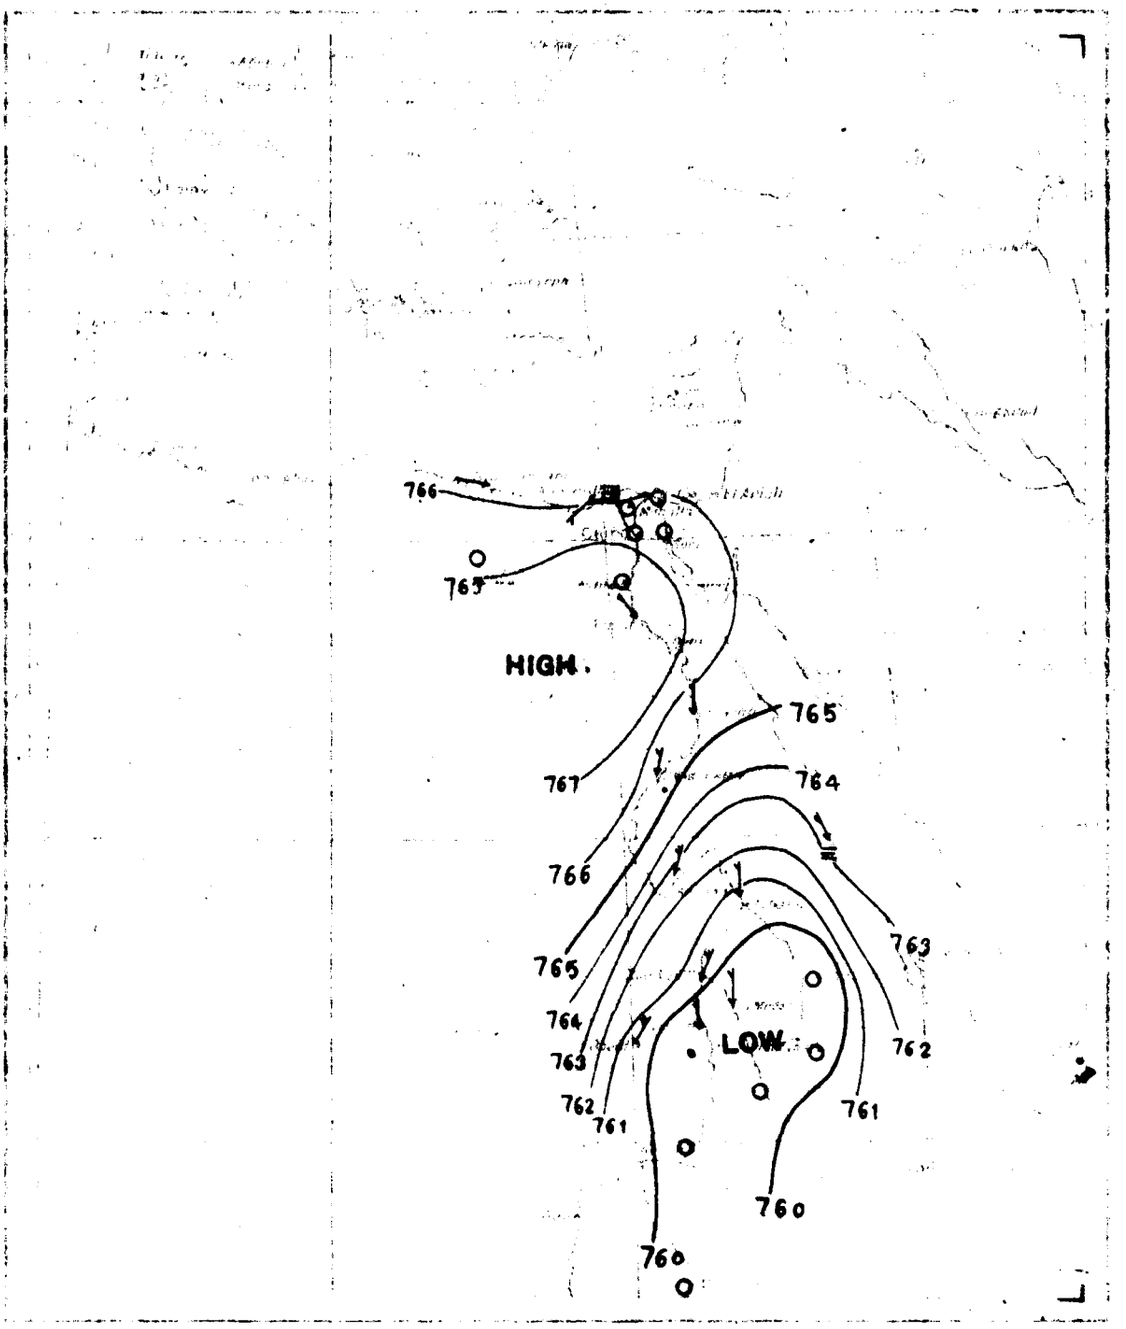
BAROMETER AND WIND 9 A.M.

29 - 11 - 1914



Survey Department, Ministry of Finance

PHYSICAL SERVICE.

REPORT ON THE WEATHER OF DECEMBER 1914.

EIGHTH YEAR: No. 12.

The mean temperature in Lower and Upper Egypt during the first two weeks of the month was practically normal, while for the two last weeks it was above normal; over Lower Egypt the 10th of the month was a cold day while the 28th was a hot one.

On the average of the month, temperatures were normal in all districts except in the Northern Sudan and in the Red Sea district represented by Port Sudan where it was above average.

Although the paths of the centres of depressions could not be traced owing to the absence of foreign information, there is evidence that during the first fortnight of the month depressions came close enough to the northern coast line to cause southerly winds, unsettled weather and abundant rainfall over the Delta. At Alexandria on the 20th a rainfall of 55 millimetres was recorded. In consequence rainfall over Lower Egypt was 10 millimetres above the average. In the Sudan rainfall was normal except for the region round Port Sudan where it was 17 millimetres above the average.

The humidity for the month at Giza was 7 per cent above the average.

The pressure was practically normal. In the Sudan the winter distribution persisted throughout the month.

Table showing the departures from normal of December 1914, by districts.

* For Port Sudan only. † For Mongalla only.

State of the River:— The Bahr el Jebel fell off rather rapidly during the month and is now below normal at Mongalla. At Malakal the White Nile continues above normal, and so also does the Blue Nile at Roseires, although the latter is falling rather more quickly than usual. At Halfa the Main Nile is a little below normal, (13 cms.)

H. E. Hurst,
Superintendent Meteorological Office.

Cairo, January 4th, 1915.
